

Notes

Goal

The note tool allows you to save Paint references, Mixes, scale computations and plastic shape references.

This way you can save mixes and scale computations for later use or store your own testing and references.

How to create notes ?

The notes can only be saved in their context. So, these are created from each screen where a Note logo button is present.

Using

The note screen is simply the repository for saved notes. Here you can see your saved notes, rearrange them, delete them and change their color and name.

You can also create folders to organize your notes. To make things simple, only one level of folder is allowed. Once created, you move your notes into them, change their color and name. To speed things up, the current selected folder is the one where notes will be saved so that you can work by projects without having to move notes to the correct place afterwards.

The Shopping List

A button is available on top of the screen to display an organized list of your notes as a shopping list. The list sums up every paint and plastic sheet references that are present in your notes as well as the number of times

those references appear. The list is also sorted by brands. The computation is a hierarchical one so when you press the button on the top folder, every single note is used for the computation; when a folder is selected, only notes that are present in this folder are used.
